

AGT introduces first USB Memory Stick with Fingerprint Authentication available in the region

Biostick 128 MB special offer to all visitors the GITEX in Dubai

Dubai, 20 October 2003 – Introducing Biostick, an USB Memory Stick with biometric authentication, AGT, a leading supplier of premier security products, solutions and services, substantially increases the level of security in using personal data storage devices. During the GITEX currently taking place in Dubai the sophisticated 128 MB version of the Biostick is available. The retail price is 850 AED.

With the introduction of the Biostick AGT adds to its comprehensive portfolio of security products, solutions and services a mass market product with the potential to become the standard within only a few months. For the moment, the AGT Biostick comes in two versions, a 128 MB and a 256 MB version, larger storage capacities will be offered as early as 2004.

«The security requirements for memory sticks have long been underestimated,» comments Mario Grossmann, Managing Director of AGT. «In the past, if you lost your memory stick everyone could spy out your stored, confidential data, manipulate it and even use it for criminal acts. The AGT Biostick has a pad where you need to authenticate yourself with your fingerprint before you can use the Biostick and gain access to the data. In addition, no software needs to be installed thereby making the Biostick ready to use on any PC or laptop,» he adds.
